- How to run backdoor.py (in terminal):
 - `$python backdoor.py <port number>`
 - Note: We are using the socketserver module which requires a newer version of python (3.4 or above)
- How to connect to it:
 - `nc localhost <port number>`
- Handshake details:
 - After you connect to the server using netcat, the handshake process will begin.
 - You will be prompted to enter a hard coded username and password.
 - The username is “boss” and the password is “badpassword”.
 - You may then begin to make use of the commands the server offers.
- Supported commands:
 - `help`, `help <command>`, `pwd`, `cd`, `ls`, `cp`, `rm`, `mv`, `cat`, `snap`, `diff`, `logout`, `off`, `who`, `net`, `ps`, and `uptime`.
 - You can use `help <command>` for a description of what the command does.
